

Space heaters are just what the name implies... they are designed and limited to heating a space... not a whole house.

All heaters sold by Geneva Industrial Group are portable electric Space Heaters. Maximum wattage allowed under ETL and UL standards is 1,500 watts. Space heaters are **NOT** intended to be your sole source of heat, they are supplementary heaters only. Performance, efficiency and effectiveness are largely based off the conditions the heater is used in.

Please read the instruction book prior to use, and follow all guidelines in the instruction book.

We Do Not Recommend the Use of Extension Cords with a space heater... however if you must, use **ONLY** a Heavy Duty appliance grade, grounded extension cord.

Never leave a space heater running unattended, or while sleeping. Always turn the heater off when you are leaving a room, or sleeping.

Never drape anything over a space heater in an attempt to warm it, dry it... or for *any* other reason.

Always make sure the space heaters are used in an open area with *nothing flammable* near or close to the heater. Never block / restrict the airflow near or round the heater.

Never use a space heater near or close to a sink, bathtub, or any source of water. Never use a space heater on a wet surface.
